HaloTag® Purification — Quick Purification Protocol from 2 × 10⁸ cells

Lyse

- 1. Resuspend the cell pellet in 5ml HaloTag® Purification Buffer.
- 2. Add 100µl of 50X Protease Inhibitor Cocktail.
- Sonicate on ice (avoid overheating as this will inhibit binding). Note: For other lysis methods please refer to TM348.
- 4. Harvest cell lysate at 4°C (10,000 \times g for 15 minutes); collect supernatant.

Equilibrate Resin

- 5. Transfer 600µl of HaloLink™ Resin slurry to a tube.
- 6. Centrifuge at $1,500 \times g$ for 5 minutes; discard the supernatant.
- 7. Wash the resin five times:
 - a. Add 5ml of HaloTag® Purification Buffer; mix for 5 minutes.
 - b. Centrifuge at $1,500 \times g$ for 5 minutes; discard the supernatant.

Bind

- 8. Add the cell lysate to the equilibrated resin.
- 9. Incubate for 90 minutes at room temperature (22-25°C) with constant mixing.
- 10. Centrifuge at $1,500 \times g$ for 5 minutes; remove supernatant, save as sample flowthrough.

Wash

- 11. Wash the resin three times:
 - a. Add 5ml of HaloTag[®] Purification Buffer; mix at room temperature for 10 minutes.
 - b. Centrifuge at $1,500 \times g$ for 5 minutes; discard the supernatant.

Cleave

- 12. Combine 9µl of HaloTEV Protease with 291µl of HaloTag® Purification Buffer.
- 13. Add the cleavage solution to the resin; incubate at room temperature (22–25°C) for 90 minutes with constant mixing.

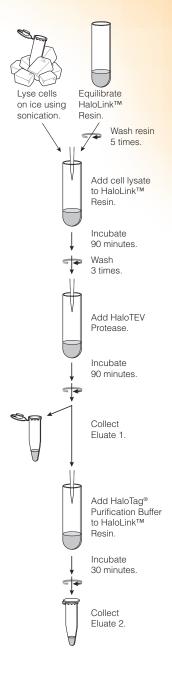

Elute

- 14. Centrifuge at $1,500 \times g$ for 5 minutes; collect the supernatant (Elution 1).
- 15. Add 300µl HaloTag[®] Purification Buffer to the resin; mix for 30 minutes at room temperature.
- 16. Transfer the resin into the spin column; centrifuge at $10,000 \times g$ for 15 seconds; collect Elution 2.
- 17. Centrifuge Elution 1 and Elution 2 at $10,000 \times g$ for 1 minute, and transfer to clean tubes.

Protocol information in Technical Manual #TM348, available online at www.promega.com

INSTRUCTIONS FOR USE OF PRODUCTS G6790, G6795 AND G6799.

HaloTag® Fusion Protein Detection

Fluorescent Labeling

Fluorescent labeling of HaloTag[®] fusion protein with the HaloTag[®] TMRDirect[™] Ligand provides a rapid and convenient method to monitor protein expression and follow the purification efficiency.

 Dilute the HaloTag[®] TMRDirect[™] Ligand stock solution (100µM) twofold in DMSO to make a 50µM working solution. Store protected from light, at -20°C.

Note: Alternatively, the stock solution can be prepare in PBS, but cannot be stored.

 Combine 10µl of lysate containing the HaloTag[®] fusion protein with 19µl of HaloTag[®] Protein Purification Buffer and 1µl of 50µM HaloTag[®] TMRDirect[™] Ligand.

Note: The equivalent amount of unbound fraction can be added in place of the lysate.

- 3. Incubate at room temperature for 15 minutes protected from light.
- 4. Add 10µl of 4X SDS gel loading buffer and heat at 70°C for 3 minutes.
- 5. Load 10µl onto an SDS-polyacrylamide gel.
- Following electrophoresis, scan the gel on a fluorescence imager such as the Typhoon[®] (excitation 532nm, emission 580nm), and quantitate band intensities.

See additional protocol information in Technical Manual #TM348, available online at **www.promega.com**
