Protocol for Amplification and Analysis of DNA from Storage Card Punches

This document is a quick protocol for experienced users to amplify DNA from storage card punches. Quick protocols are also available for amplifying extracted DNA and DNA from swabs. For complete protocol information and troubleshooting tips see the PowerPlex® Fusion System Technical Manual #TMD039, which is available online at: www.promega.com/protocols/

Before You Begin

The PowerPlex® Fusion System is compatible with the following sample types:

<table>
<thead>
<tr>
<th>FTA® Sample Types</th>
<th>Non-FTA Sample Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buccal cells collected on FTA® cards with Whatman EasiCollect™ or Fitzco Sampact™ devices</td>
<td>Buccal samples on Bode Buccal DNA Collector™ devices</td>
</tr>
<tr>
<td>Buccal cells collected with sterile swabs transferred to FTA® or Indicating FTA® cards</td>
<td>Blood and buccal samples on non-FTA card punches</td>
</tr>
<tr>
<td>Liquid blood (from collection or storage Vacutainer® tubes or finger sticks) spotted onto FTA® cards</td>
<td>Blood and buccal samples on non-FTA card punches</td>
</tr>
</tbody>
</table>

No preprocessing steps are required for FTA® card punches. For non-FTA cards, the punches must be preprocessed as described below. For complete protocol information see the PunchSolution™ Kit Technical Manual #TMD038, which is available online at: www.promega.com/protocols/

1. Add 10µl of PunchSolution™ Reagent (Cat.# DC9271) to each 1.2mm punch placed in a well of the 96-well reaction plate. Note: Do not cover the plate or place the plate in a thermal cycler with a closed, heated lid.
2. Incubate plate at 70°C for 30 minutes or until wells are dry.

PCR Setup

1. Thaw all pre-amplification components just prior to use.
2. Vortex the components thoroughly for 15 seconds. Centrifuge tube briefly, then vortex for 15 seconds before each use. Do not centrifuge after vortexing.
3. Determine the number of reactions including positive and negative controls. Add 1 or 2 reactions to this number.
4. Prepare the PCR amplification mix by combining the components as shown below.

<table>
<thead>
<tr>
<th>Component</th>
<th>Volume Per Reaction</th>
<th>×</th>
<th>Number of Reactions</th>
<th>=</th>
<th>Final Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water, Amplification Grade</td>
<td>15µl</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PowerPlex® Fusion 5X Master Mix</td>
<td>5.0µl</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PowerPlex® Fusion 5X Primer Pair Mix</td>
<td>5.0µl</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total volume</td>
<td>25µl</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. Vortex the PCR amplification mix for 5–10 seconds.
6. For FTA® or PunchSolution™ Reagent-treated non-FTA punches, add one 1.2mm punch for blood samples or one or two 1.2mm punches for buccal samples to 25µl of PCR amplification mix. Optimize the number of punches if necessary.
7. For the positive amplification control, add 1µl of 2800M Control DNA (10ng) to a reaction well containing 25µl of PCR amplification mix. Do not add a punch to this control reaction.
8. Seal the plate, and briefly centrifuge the plate.

Use of the PowerPlex® Fusion System to Amplify DNA from Storage Card Punches

INSTRUCTIONS FOR USE OF PRODUCTS DC2402 AND DC2408.

PCR

The PowerPlex® Fusion System is validated for use with the GeneAmp® PCR System 9700 with a silver or gold-plated silver sample block with Max mode as the ramp speed.

1. Program the thermal cycler with the following conditions. Refer to the technical manual for more information. For DNA from punches we recommend using 27 cycles. Optimize the cycle number as required.

Optional: Record the cycle number as optimized in your laboratory.

2. Proceed with the analysis, or store amplified samples at –20°C in a light-protected box until ready to analyze.

Quick Protocol

Instrument Setup and Sample Preparation

A passing spectral calibration must be generated using the PowerPlex® 5C Matrix Standard (Cat.# DG4850) prior to sample analysis. See the PowerPlex® 5C Matrix Standard Technical Manual #TMD049 for more information.

Instrument Setup

1. For the Applied Biosystems® 3500 or 3500xL Genetic Analyzer, we recommend preheating the oven at 60°C for at least 30 minutes prior to the first injection.

2. Use the following parameters when setting up the instrument. Refer to the instrument user’s manual for additional details.

<table>
<thead>
<tr>
<th>Genetic Analyzer</th>
<th>Run Module</th>
<th>Dye Set</th>
<th>Injection Parameters¹</th>
<th>Run Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applied Biosystems® 3500</td>
<td>HID36_POP4</td>
<td>Promega G5</td>
<td>1.2kV, 15 seconds</td>
<td>1,210 seconds</td>
</tr>
<tr>
<td>Applied Biosystems® 3500xL</td>
<td>HID36_POP4</td>
<td>Promega G5</td>
<td>1.2kV, 24 seconds</td>
<td>1,210 seconds</td>
</tr>
<tr>
<td>Applied Biosystems® 3130 and 3130xl</td>
<td>HIDFragmentAnalysis36_POP4</td>
<td>G5²</td>
<td>3kV, 5 seconds</td>
<td>1,500 seconds</td>
</tr>
<tr>
<td>ABI PRISM® 3100 and 3100-Avant</td>
<td>HIDFragmentAnalysis36_POP4</td>
<td>G5²</td>
<td>3kV, 5 seconds</td>
<td>1,500 seconds</td>
</tr>
</tbody>
</table>

¹Injection time may be modified (2–24 seconds) to increase or decrease the observed peak heights.

²Confirm that the active dye set is the file generated for the PowerPlex® 5-dye chemistry.

Optional: Record the injection conditions as optimized in your laboratory.

Additional Notes:
Sample Preparation

Prepare samples for capillary electrophoresis immediately before loading.

1. Centrifuge the WEN Internal Lane Standard 500 (WEN ILS 500) briefly, then vortex for 15 seconds before each use. Do not centrifuge after vortexing.
2. Calculate the number of reactions including the number of allelic ladders per run. Add 1 or 2 reactions to this number.
3. Prepare a loading cocktail by combining and mixing the WEN ILS 500 and Hi-Di™ formamide. You may need to optimize the volume of WEN ILS 500.
   
   Optional: Record the volume of WEN ILS 500 per sample as optimized in your laboratory.
4. Vortex the loading cocktail for 10–15 seconds, and pipet 10µl of formamide/internal lane standard mix into each well.
5. Add 1µl of amplified sample (or 1µl of PowerPlex® Fusion Allelic Ladder Mix). Cover wells with appropriate septa, and centrifuge plate briefly.
6. Denature samples at 95°C for 3 minutes, then immediately chill on crushed ice or in an ice-water bath for 3 minutes. Denature samples just prior to loading the instrument.
7. Place the plate assembly on the autosampler.
8. Start the capillary electrophoresis run.

Additional Notes:

Data Analysis

The panels, bins and stutter text files needed for data analysis using GeneMapper® ID software, version 3.2, and GeneMapper® ID-X software, version 1.2 or higher, are available for download at: www.promega.com/resources/software-firmware/genemapper-id-software-panels-and-bin-sets/

For complete protocol information see the PowerPlex® Fusion System Technical Manual #TMD039, available online at: www.promega.com/protocols/
